Gas Emissions

Cell: EN2

Comment: Rick Heede:

See the "Gas Emissions Factor Calc" worksheet for details, which accounts for carbon content, heating values, and final emission factor per billion cubic feet (Bcf) of gas production, including deducting for non-energy uses of natural gas (see "non-energy uses" worksheet). Ancillary emissions of fugitive methane, vented CO₂, and CO₂ from flaring are estimated and applied in the summary entity worksheet.

Cell: C13

Comment: Rick Heede:

ADNOC details both gas production and utilization rates from 1974 through 1994 in its annual reports; see ADNOC gas production worksheet for details.

Cell: C17

Comment: Rick Heede:

CMS estimated the CO₂-equivalent of Apache Corporation's 1981-1983 gas blow-out (assuming all of the gas was vented and none of it was flared). The company reported a blow rate of 35 million cf per day, which we use as the average over the sixteen month event: 35 million cf/d = 0.0168 Tcf over 30d*16months = 0.01858 Qbtu (at 1,106 Btu per cf for wet gas), which, at 14.92 MtC/Qbtu, equals 0.2772 MtC (1.01581 MtCO₂) and thus (at CH₄ at 23xCO₂) = 6.3762 MtC-eq (23.3636 MtCO₂-eq). This represents a significant additional impact of Apache's total estimated emissions from natural gas and oil production. See cell comment at Apache Corporation worksheet for details.

This amount is added to Apache's estimated emissions in 1982.

Cell: ES17

Comment: Rick Heede:

26Jan06 estimate of the CO₂-equiv of the Apache's blow-out (assuming none of it was flared, and using only 50 percent of the 35 million cf per day): 17.5 Mcf = 0.0084 Tcf over 30d*16 months = 0.00929 Qbtu (at 1,106 Btu per cf for wet gas), which, at 14.92 MtC/Qbtu, equals 0.139 MtC (0.508 MtCO₂) and thus (at CH₄ at 23xCO₂) = 3.19 MtC-eq (11.7 MtCO₂-eq). These emissions are NOT included in this summary.

Cell: ES19

Comment: Rick Heede (Jan10):

Bahrain: Banagas annual emissions of CO₂-equivalent if the reported 3 million SCM per of natural gas vented to the atmosphere (prior to 1979 only) is estimated by CMS to total 56.3 million tonnes of CO₂e per year (MtCO₂e/yr). If the natural gas (assumed to be all methane, since CMS does not have data on entrained CO₂ and other entrained gases) is assumed to be flared rather than vented, then emissions would total 2.25 MtCO₂/yr.

Cell: ES131

Comment: Rick Heede:

CDIAC data in million tonnes of carbon converted to CO₂, which is 3.664191 times Carbon if carbon and oxygen isotopes are accounted for, per Kevin Baumert May05, then at World resources Institute: CO₂ conversion is, precisely: C=12.0107 + O=15.9994 x 2 = 44.0095/12.0107 = 3.664191.

Cell: ES133

Comment: Rick Heede:

From the associated "Methods" paper: CDIAC's emissions are estimated for each fuel using the following formula: CO₂ = (P) (FO) (C).

From primary and secondary gas fuel production and trade:

CO₂ = CO₂ emissions in 10⁶ metric tonnes of carbon;

P = annual production or consumption in thousands of 10¹² joules;

FO = 0.98 ± 1%;

C = carbon content in 10⁶ tonnes per thousand 10¹² joules = 0.0137 ± 2%.

Boden, T.A., G. Marland, and R.J. Andres. 2009. Global, Regional, and National Fossil-Fuel CO₂ Emissions. Carbon Dioxide Information Analysis Center, Oak Ridge National Laboratory, U.S. Department of Energy, Oak Ridge, Tenn., U.S.A. doi 10.3334/CDIAC/00001.

Jan10: CMS added CDIAC extrapolations for gas emissions from their dataset "Preliminary 2007-08 Global & National Estimates by Extrapolation" (undated) to the main file cited above.

Updated emissions data for 2011-2013 from Global Carbon Project/CDIAC Global emissions 1959-2013, on 22Sep14.
